

## Claims

1. (original) A hand-held power tool, in particular a sander, having a housing (10) and a motor (12) located in the housing (10), by way of which motor a driven shaft (16), extending from a face end (14) of the housing (10), is drivable, and having a suction conduit (18), extending at least partway through the housing (10), characterized in that the suction conduit (18) discharges at the face end (14).

2. (original) The hand-held power tool as recited in claim 1, characterized in that the suction conduit (18) extends, in at least one region, by at least 180° around the driven shaft (16).

3. (original) The hand-held power tool as recited in claim 2, characterized in that the suction conduit (18) extends, in at least one region, by at least 360° around the driven shaft (16).

4. (currently amended) The hand-held power tool as recited in ~~one of the foregoing claims~~ claim 1, characterized in that the suction conduit (18), in at least one region, has a spacing of less than 1 cm from the driven shaft (16).

5. (original) The hand-held power tool as recited in claim 4, characterized in that the suction conduit (18), in at least one region, directly adjoins the driven shaft (16).

6. (currently amended) A tool receptacle having at least one suction conduit (20), which is intended for installation in a hand-held power tool as recited in ~~one of the foregoing claims~~ claim 1.

7. (original) The tool receptacle as recited in claim 6, characterized in that the suction conduit (20) has at least one transverse conduit segment (22), which extends at least substantially parallel to a sanding plane (24).

8. (original) The tool receptacle as recited in claim 7, characterized in that the transverse conduit segment (22) is embodied as open in the direction toward the sanding plane (24).

9. (currently amended) A system having a hand-held power tool as generically defined by ~~the preamble to claim 1, and in particular as recited in one of the foregoing claims,~~ and having a tool receptacle with a suction conduit (20), wherein the suction conduit (18) in the housing (10) of the hand-held power tool and the suction conduit (20) in the tool receptacle are intended for direct coupling.

10. (original) The system as recited in claim 9, characterized in that the suction conduit (18) in the housing (10) of the hand-held power tool and the suction conduit (20) in the tool receptacle, in the installed state of the tool receptacle, are coupled via a region (26) that is open toward the outside.
